LABORATORY WORK #1

Learn CSS and HTML

Author:
BOICU STEFAN
std. gr. FAF-203

Supervisor:
Alexei ȘERȘUN

Chișinău 2023

1 Task

Our task for this laboratory work was to:

1. Download the design provided as a PSD file.
2. Extract the images as JPG files.
3. Copy 'index.html', 'reset.css' and 'style.css' to our repository.
4. Update 'index.html' and 'style.css', so that the page looks similar to the design from the PSD file.

2 Results

I did all the pages required for the full mark. The project is made for screen aspect ratio of 16:10 or 16:9. I mainly used flexboxes so it handles rezising moderately well. It is **not** adapted for mobile devices.

The main challenge of the project was learning HTML and CSS from 0 on short notice. Getting the styles right required a lot of trial and error. The relation between HTML structure, css styles and the wrapping of divs and flexboxes was tricky at first.

Also, due to a bug from windows or vs-code my style.css file was lost right after finishing the landing section. Thankfully the skills aquired while working on it enabled me to redo the work of two days in around half an hour. This was a clear, if painful, representation of my progress in learning html and css.

Working on the following pages I was more confident and finished them relatively fast. I also reused many of the same styles on the rest of the pages.

Below are screenshots of all the sections

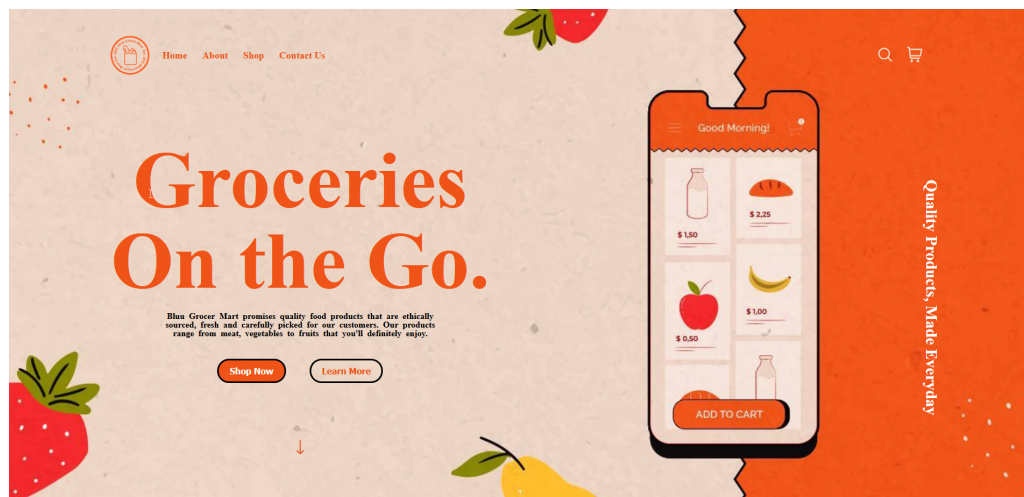

Figure 1: FAQ section.

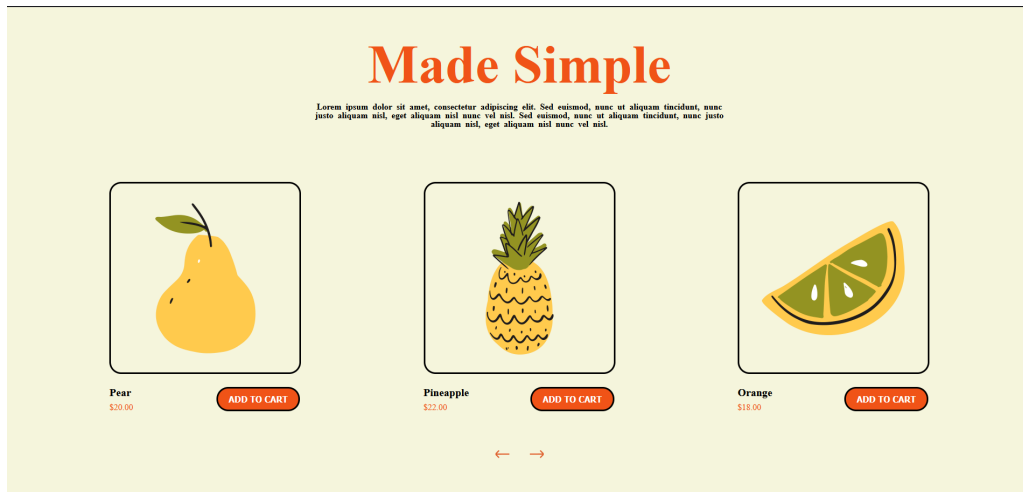

Figure 3: FAQ section.

Figure 4: FAQ section.

The code of the HTML is fairly straight-forward. I structured everything in divs and then put them one inside the other as needed to accomplish my goal. I tried not to nest more containers within each other than necessary. I also used `<section>` and `<nav>` containers as suggested by the MDN and didn't rely solely on `<div>`.

The most complex piece of HTML code got to be the **Made Simple** section where I aligned both the cards themselves as well as the contents of the cards as flex-containers in order to evenly space everything. Then I only had to play with the margin for a bit to finish it.

```

1 <section class="hero-image section-3">
2   <div class="hero-box hero-text hero-text-2 orange">
3     <h1>Made Simple</h1>
4     <p>Lorem ipsum ...</p>
5   </div>
6   <div class="container display-container">
7     <div class="display-card">
8       <div class="display-img-box display-card">
9         
10      </div>
11      <div class="display-card-desc">
12        <div>
13          <p class="display-text-name">Pear</p>
14          <p class="orange">$20.00</p>
15        </div>
16        <button class="...">Add to cart</button>
17      </div>
18    </div>
19    <div class="display-card">...</div>
20    <div class="display-card">...</div>
21  </div>
22  <div class="display-btn-box">
23    <button class="...">
24    <button class="...">
25  </div>
26 </section>

```

Listing 1: Made simple HTML code

As for CSS, it took a while to get comfortable with it. The most important building block was the flex-box container which I used in the project, as well as some variations of it. The rest was about configuring the correct margins, heights and widths for all elements, choosing the colors and font sizes. An example of the CSS used is provided below

```

1 .container {
2   display: flex;
3   justify-content: space-between;
4   align-items: center;
5   align-content: center;
6 }
7
8 .main-page-header {
9   padding-top: 50px;
10  max-width: 80%;
11  margin: auto;
12 }

```

Listing 2: CSS code sample

3 Conclusion

First and most important conclusion, I will not become a front-end dev.

Otherwise, I learned the basics of html. I structured the contents in the page using divs, sections, buttons and more. I learned and applied the basics of html layout in the scope of the project.

HTML and CSS, not being programming languages but markdown languages provided new challenges that needed overcoming. As well as a different mindset for problem solving.

As part of the project I also learned CSS and the basics of styling. How to style text and containers in order to achieve the desired result. The main technique I used for CSS layout was flex-box.
